

Task 15: Product Count Analysis

Level 1 • Day 15 of 45

Name	Akshat Srivastava
Track	Data Analytics
Tool Used	MS Excel
Objective	Practice COUNTIF / COUNTIFS
Dataset	Superstore (sample/practice dataset)

1. Description

The task requires counting products by category in the Superstore dataset and identifying the category with the largest number of products.

2. Approach

- Reviewed the **Category** column in the dataset and identified the unique categories present: Furniture, Office Supplies, and Technology.
- Used the **COUNTIF()** function to count the number of products belonging to each category, e.g. `=COUNTIF(Orders!C:C, "Furniture")`.
- Built a summary table (Category vs. Product Count) using the formula results.
- Cross-verified the counts by building a **PivotTable** (Rows = Category, Values = Count of Category); the results matched the COUNTIF output.
- Used **INDEX + MATCH** to automatically identify the category with the maximum product count: `=INDEX(A4:A6, MATCH(MAX(B4:B6), B4:B6, 0))`.

3. Product Count Table (Result)

Category	Product Count
Furniture	40
Office Supplies	38
Technology	42

4. Top / Largest Category

Technology is the largest category, with **42 products** — the highest count among the three categories in the dataset.

5. Deliverables Completed

- Product Count Table (by category)
- Top Category identified: Technology

6. Learning Outcome

Practiced using COUNTIF/COUNTIFS to summarize categorical data efficiently, and learned to cross-verify formula-based results using a PivotTable for accuracy.
